Hiring Team
DD Consulting
Sydney, Australia

Dear DD Consulting Hiring Team,

The phrase that stopped me in DD Consulting's Fellowship description wasn't the salary or the certification subsidy — it was *Building AI using AI*. I'd already been living that at Traveloka: embedding GitHub Copilot CLI into our backend squad's workflow didn't just accelerate delivery, it changed how the team reasoned about automation itself. That hands-on experience with agentic tooling, combined with a genuine interest in how AI systems are governed and audited, is what draws me to this Fellowship and to the multi-disciplinary model DD Consulting has built around it.

At Traveloka, one of the largest flight inventory providers had no automated reschedule path — operators manually handled thousands of daily booking modifications. I built an end-to-end agentic pipeline with configurable scrapers, failover backup mechanisms, and 99.9% processing accuracy, cutting manual intervention by 85%. The governance half was equally deliberate: I engineered a Credential Management System with AES-GCM encryption and granular audit logging, because autonomous workflows that can't be traced or constrained aren't productivity tools — they're liabilities. Those two projects, taken together, are a close analogue to what the Fellowship asks for: autonomous system implementation paired with the accountability layer to make it safe to operate.

DD Consulting's specialisation in auditing AI systems against ISO 42001 sits at exactly the intersection I want to build expertise in. I've been running on GCP throughout my time at Traveloka — BigQuery pipelines, containerised deployments, cloud-native CI/CD — and I'm actively working through the AWS Solutions Architect path, so the cloud infrastructure side of the Fellowship is ground I'm already covering. What excites me most is the consulting dimension: translating complex multi-agent architectures into something a non-technical stakeholder can understand, trust, and sign off on. That's a skill I started developing as a mentor at Fasilkom and as a cross-functional liaison between engineering and design divisions at COMPFEST.

I'd welcome the chance to discuss how DD Consulting's Temporal Gate programme structures the transition from hands-on development to governance consulting — and whether the agentic workflow experience I've built maps to the kinds of client challenges the team is currently navigating.

Sincerely,

Musthofa Joko Anggoro

University of Indonesia, Fasilkom · Information Systems · GPA 3.84/4.00 · Expected graduation June–August 2026
