Hiring Team  
Permata Bank  
Tangerang, Banten, Indonesia

Dear Permata Bank Hiring Team,

Processing 1,000+ flight-booking modifications a day with 99.9% accuracy sounds like an automation win — but the harder part was designing a core engine resilient enough that **no transaction could silently fail**. That same design discipline is what drew me to Permata Bank's Core Engine Developer role: a KBMI 3 bank running near-50 trillion rupiahs in core capital demands exactly that level of stability from the systems underneath it.

At Traveloka, one of Indonesia's largest flight inventory providers had no automated reschedule path — operators manually handled thousands of booking modifications daily. I designed and built an end-to-end Java / Spring Boot engine with configurable scrapers, failover logic, and structured audit logging, deployed on Linux production servers. The result: **85% reduction in manual intervention** at 99.9% transaction accuracy. Operators shifted from repetitive exception handling to genuine issue resolution — the kind of impact that only comes when the core engine underneath is solid.

Permata Bank's recognition in the HR Excellent Award 2024 for Learning Development tells me this is a team that invests in engineers, not just headcount. That matters to me, because I write code as a craft — every design decision should be traceable and defensible, not just functional. My background in Spring Boot microservices, PostgreSQL (RDBMS) performance tuning, and CI/CD pipeline integrity maps directly to the core engine work you've described, and I'm actively deepening my understanding of distributed systems and high-availability architectures.

I'd welcome the chance to discuss how my work on transactional reliability at Traveloka applies to Permata Bank's core engine challenges — particularly around stability, root-cause investigation, and failover design. I'm looking forward to exploring whether this is the right match.

Sincerely,

**Musthofa Joko Anggoro**
